

Ajun Jo

4th year Statistics in University of Waterloo

Waterloo, Canada | 905-651-5768 | joajune03@gmail.com | [Snapshots.Me](#) | [GitHub](#) | [LinkedIn](#)

QUALIFICATIONS & TECH STACKS

Data Analytics: NumPy, Pandas, SQL, R, Matplotlib, Excel, Power BI

Programming: Python, C, C++, and Linux, Git, Google Colab

AI / Machine Learning: TensorFlow, PyTorch, NumPy, Pandas, Scikit-learn, AWS SageMaker.

EDUCATION

University of Waterloo

Waterloo, Ontario, Canada

Double major in Bachelor of Honours Statistics and Computational Mathematics | Minor in Computing

Sep. 2021 – April 2026

Relevant Coursework:

- Probability, Statistics, Applied Linear Models, Statistical Learning, Data Visualization, Data Structures, Optimization, OOP, Data-Intensive Distributed System, Neural Networks

Awards:

- University of Waterloo President's Scholarship

Extracurriculars:

- Prev. Event exec. Data Science club
- **Sports:** Semi-comp league Basketball Intramural, beginner level soccer Intramural (Placed first in league)

EXPERIENCE

Data Developer

Toronto, Ontario | Jan. 2025 – Apr. 2025

Scotiabank

- Lead an end-to-end development of Time Study tool using Python that collects data from branch employees investigating time efficiency of branch activities and customized the tool to four other internal teams assisting them to gain productivity insights for their products
- Conducted time study experiment launched across over **150 different branches** across Canada to test an AI tool that assists branch employees to look up branch policies and guidelines information
- **Consolidated over 100k** of time study data to analyze branch activities using Excel pivot tables to report inactive branches in the experiment, find out frequently completed activities and geographical analysis of branches.

AI Data Engineer

Etobicoke, Ontario | May 2024 - Aug. 2024

Vosyn

- Reduced **data processing time by 30%** through data pipelining, creating ETL processes, while ensuring data accuracy, and preparing multilingual datasets for training Text-to-Speech models
- Tested, and debugged the realignment code that synchronizes the translated speech and lip movements (dubbing)
- Optimized Text-to-Speech model by writing a script that reduced background noise, elevating output voice quality

PROJECTS

DeepRank AI (League of Legends)

Jan. 2025 – Present

Project Summary: An AI program that determines a player's tier based on their recent performance in ranked match history

- Created data ETL process for 160k player and match data through the Riot API used for machine learning
- In the process of training XGBoost, Deep learning and logistic regression models for accuracy comparison
- Projected to elevate into a web application through frontend, presenting a polished UI for the potential users.

Text-to-Speech Model Denoiser (Co-op)

June 2024 – July 2024

Project Summary: A production level script that runs through audio files that denoises background sounds

- Reduced interruptive noises for Text-to-Speech (LLM) model outputs by creating a script that uses the API of UVR models that fundamentally clean dirty background noises as well as providing clearer vocal quality.
- Had been utilized in Voice Cloning products at previous company, the result **significantly increased the output voice quality** by providing clear audible sounds and clarifying the speaker's vocal

Personal Finance Automation

Nov.2023 - Dec.2023

Project Summary: An analysis program that helps users to manage and gain an overview of their spending trends

- Conducted data visualization on personal spendings using NumPy, Pandas and Matplotlib
- Developed a linear regression model using machine learning to predict future spending patterns
- Cleaned dataset by removing null values and renaming columns to clarify domain types
